

# Orchestrating memory disaggregation with Compute Express Link (CXL)

Memory demand has grown **exponentially** as workloads like AI, machine learning (ML), big data, and analytics have gained popularity. To help address this challenge, Intel spearheaded the formation of Compute Express Link (CXL) in 2019.

CXL is an **open interconnect standard** that primarily facilitates data communication among heterogeneous computing devices and also allows for system memory expansion.

The key advantage of CXL is that it **enables memory media independence** and provides a standard, media-independent connection to virtually any memory type.

CXL is set to be the **de facto cache coherent interconnect standard in data centers soon** and is expected to influence future computer architecture substantially.

The latest Intel® Xeon® processors offer unique CXL features for improving system memory capacity and bandwidth. This allows for workload performance improvement and reducing memory TCO.
