

Q1. Write a shell script called `timely_greeting.sh` that greets you based on the current time. The script should call the `date` command, extract the current hour (look into using `%H`) and then print the following greeting based on the time.

If it is between 5AM (05:00) and 12PM (12:00): Good morning!

If it is between 12PM (12:00) and 6PM (18:00): Good afternoon!

If it is between 6PM (18:00) and 5AM (5:00): Good night!

Show the greeting message each time you open the terminal.

Q2. (a) Write a shell script `sum.sh` that takes an unspecified number of command line arguments of integers and finds their sum. Usage `sum.sh 1 2 3 45 8 -10 ...`

(b) Modify the code to add a number to the sum only if the number is greater than `n`. Usage `sum.sh -g n 1 2 23 45 47 ...`

Q3. Write a shell script that takes a directory name as an argument and return the number of text files, sub directories, links, character and block devices

Q4. Modify `mycal` (discussed in the class) to accept more than one month, as in `mycal.sh oct nov` or perhaps a range of months `oct – dec`

Q5. Use `grep` command to find words that contain all five vowels in alphabetical order.
