

Cauchy-Schwarz Inequality

Statement: For any two random variables X and Y , we have

$$|E(XY)| \leq \sqrt{E(X^2)E(Y^2)},$$

with equality if and only if $P(X=\alpha Y)$ for some constant $\alpha \in \mathbb{R}$.

Proof: Consider the random variable $W = (X - \alpha Y)^2$. Clearly, W is a non-negative random variable for any $\alpha \in \mathbb{R}$. Thus we have,

$$\begin{aligned} 0 \leq E(W) &= E[(X - \alpha Y)^2] \\ &= E[X^2 - 2\alpha XY + \alpha^2 Y^2] \\ &= E(X^2) - 2\alpha E(XY) + \alpha^2 E(Y^2). \end{aligned}$$

Take $\alpha = \frac{E(XY)}{E(Y^2)}$. Then, we have,

$$\begin{aligned} 0 &\leq E(X^2) - 2 \frac{(E(XY))^2}{E(Y^2)} + \frac{(E(XY))^2}{E(Y^2)} \\ \Rightarrow E(X^2) - \frac{(E(XY))^2}{E(Y^2)} &\geq 0 \\ \Rightarrow (E(XY))^2 &\leq E(X^2)E(Y^2) \\ \Rightarrow |E(XY)| &\leq \sqrt{E(X^2)E(Y^2)}. \end{aligned}$$

Now if $|E(XY)| = \sqrt{E(X^2)E(Y^2)}$

$$\Rightarrow (E(XY))^2 = E(X^2)E(Y^2)$$

$$\Rightarrow E(X^2) - \frac{(E(XY))^2}{E(Y^2)} = 0$$

$$\Rightarrow E(X^2) - 2 \frac{E(XY)}{E(Y^2)} \cdot E(XY) + \frac{(E(XY))^2}{(E(Y^2))^2} E(Y^2) = 0$$

$$\Rightarrow E\left(X - \frac{E(XY)}{E(Y^2)} Y\right)^2 = 0$$

$$\Rightarrow X = \frac{E(XY)}{E(Y^2)} Y \quad \text{with probability 1.}$$
